Question 1: Digital Logic Design

Q: Design a combinational circuit that takes three inputs (A, B, C) and outputs 1 when exactly two inputs are high, and 0 otherwise.

Solution Approach:

- Use a truth table to identify input combinations where exactly two inputs are high.
- Derive the Boolean expression for the output.
- Simplify using Boolean algebra or Karnaugh maps.
- Implement using logic gates.

Question 2: Microprocessor Architecture

Q: Explain the role of the program counter (PC) in a microprocessor and how it interacts with instruction fetching.

Solution Approach:

- Describe that the PC holds the memory address of the next instruction.
- During instruction fetch, the PC supplies this address to the memory unit.
- After fetching, the PC is updated to point to the subsequent instruction, either sequentially or via branch instructions.

Question 3: Data Structures

Q: Write a pseudocode to implement a stack using an array, including push and pop operations.

Solution Approach:

- Define an array and a variable top to keep track of the stack's size.
- For push: check for stack overflow, then insert the element at top+1 and increment top.
- For pop: check for underflow, then return the element at top and decrement top.

Question 4: Operating Systems

Q: What is deadlock in an operating system? Describe the necessary conditions for a deadlock to occur.

Solution Approach:

- Define deadlock as a situation where processes are waiting indefinitely for resources held by each other.
- List the four necessary conditions: Mutual exclusion, Hold and wait, No preemption, Circular wait.

Question 5: Networking

Q: Differentiate between TCP and UDP protocols.

Solution Approach:

- Explain that TCP is connection-oriented, reliable, and ensures ordered delivery.
- UDP is connectionless, faster, but does not guarantee delivery or order.
